# DATA CENTER TRENDS 2023

# Data Center Trends - 2023

---

## 1 Advancement or expansion of data center infrastructure

Cloud computing is driving the data center industry with its ability to use resources over the Internet without physical hardware investment. Gartner predicts a 20% growth in worldwide spending on public cloud services in 2023, despite inflation and economic challenges. Cloud computing is a dominant trend that is here to stay.

## 2 Continuous evolution of hybrid cloud model

A hybrid cloud combines public and private clouds to leverage their respective benefits while mitigating weaknesses. It allows organizations to store sensitive data on a private cloud while utilizing the cost savings and flexibility of a public cloud for other workloads. Workload flexibility and access to multiple cloud providers make the hybrid cloud ideal for organizations with complex or specialized requirements.

# Data Center Trends - 2023

---

## 3 Prevalent use and influence of hyper-scale data centers

Hyperscale data centers are large, complex facilities designed for rapid deployment of servers. Dominated by companies like Amazon, Microsoft, Alphabet, Alibaba, and Facebook, these data centers support the processing of massive amounts of data. Despite market fluctuations, the hyperscale data center market is projected to grow at a CAGR of around 3.38% from 2021 to 2026.

## 4 Integration of artificial intelligence and machine learning technologies into data centers

Artificial intelligence and machine learning are used in data centers to automatically place workloads on suitable servers, predict and prevent failures, and optimize energy usage. Through analysis of data from sensors, logs, and other sources, these algorithms can identify patterns and trends, taking proactive action to prevent failures and reduce energy consumption.

# Data Center Trends - 2023

---

## 5 **Combination or harmonization of 5G networks and edge computing**

The introduction of 5G networks will have a significant impact on the data center industry, enabling data-hungry technologies like virtual reality, augmented reality, self-driving cars, remote healthcare, precision farming, and digitized logistics. These technologies require specialized infrastructure and software due to their data-intensive nature.

## 6 **Increasing prevalence or emergence of automation**

Automation is on the rise in data centers, with technology and software being used to automate tasks and processes. This includes monitoring the health and performance of data center components, detecting and responding to potential issues, performing routine maintenance tasks, and reducing the reliance on manual labor.

# BEST PRACTICES TO MANAGE DATA CENTER

# Best Practices

## Consider partnering with an expert

Monitoring and managing data center infrastructure is a time-consuming and complex process that requires expertise. Consider partnering with an experienced provider to execute a physical and logical audit.

## Implement ongoing monitoring

Unplanned changes are bound to happen, and it's vital to detect and address them before they result in outages. Ongoing monitoring can help identify changes and facilitate the necessary corrective actions.

## Keep servers patched

Keeping servers updated with the latest patches and security updates is critical for maintaining the data center's security and stability.

## Document all data center assets

It's crucial to have a complete and accurate inventory of all data center assets. Instead, invest in a robust asset management system that can efficiently track and manage all data center assets.

## Maintain a single system of record

Ensure everyone involved in managing data center assets uses the same system of record. All changes to the infrastructure must be reflected in the system of record, including physical records, such as pictures of racks.

## Understand your goals

Understand the organization's goals and requirements for the data center infrastructure. Avoid over-engineering or overspending on unnecessary features or redundancies that don't align with the organization's objectives.
